## Finding of No Significant Impact Eradication of Isolated Populations of Light Brown Apple Moth in California Revised Environmental Assessment June, 2007

The U.S. Department of Agriculture (USDA), Animal and Plant Health Inspection Service (APHIS), has prepared a revised environmental assessment (EA) that analyzes potential environmental consequences of eradicating isolated populations of light brown apple moth (*Epiphyas postvittana*) (LBAM) in California. The EA, incorporated by reference in this document, is available online at <a href="http://www.aphis.usda.gov/plant\_health/ea/downloads/lbam-ea-07-18-07.pdf">http://www.aphis.usda.gov/plant\_health/ea/downloads/lbam-ea-07-18-07.pdf</a> and from:

Riverdale, MD 20737–1236

The revised EA analyzed alternatives consisting of (1) maintaining the Federal quarantine order without further action by APHIS (no action alternative), and (2) continuation of the Federal quarantine order along with eradication of isolated populations of LBAM in California with the use of *Bacillus thuringiensis kurstaki* (Btk) and/or LBAM-specific pheromone (treatment alternative). The revised EA evaluated the potential impacts from eradication treatments of small, isolated populations and determined that any potential impacts would be limited. Since the circumstances surrounding each isolated population are unique, each site will be considered in a finding of no significant impact (FONSI) prior to treatment. This FONSI addresses the treatment for LBAM in Dublin, in Alameda, California (see attachment 1).

## Treatment in Dublin Eradication Area

In July 2007, two LBAMs were found in Dublin. Twist ties were used to treat a 200 meter radius around each of the two finds. Recently, five LBAMs were detected in the same area. An eradication boundary has been defined (see attachment 1). This FONSI addresses not only treatment for the five finds but also any additional finds within the eradication boundary. Maps for future treatment sites within this potential treatment area will be posted online at <a href="http://www.aphis.usda.gov/plant">http://www.aphis.usda.gov/plant</a> health/ea/lbam.shtml

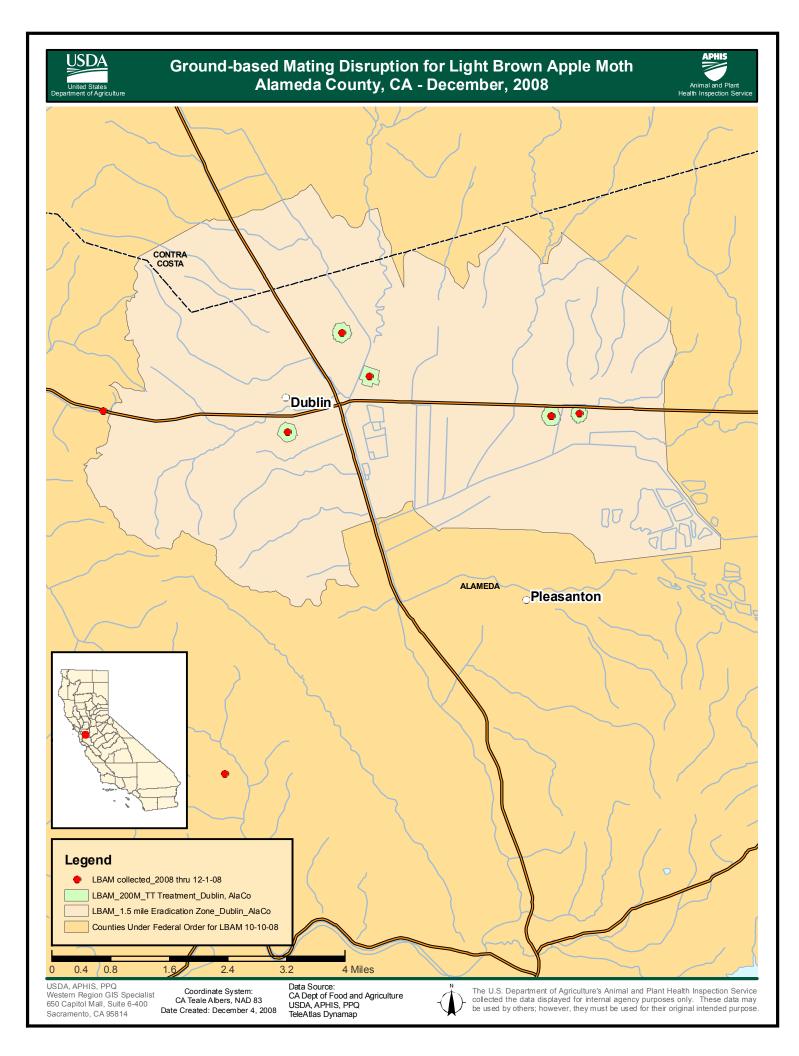

When an LBAM is found within this eradication boundary, a 200-meter radius area will be defined as a treatment area for each find. The treatment areas will be treated with Isomate-LBAM plus (pheromone-impregnated twist ties) at a rate of 250 dispensers per acre by attaching the twist ties to trees, shrubs, and other fixtures. The twist ties allow for the continual release of pheromone over the course of 120 days. The twist ties will be removed after two LBAM life cycles (a lifecycle could be up to six months in certain areas). In some cases the twist ties may be replaced for additional treatments. When all treatments are completed, the twist ties will be removed.

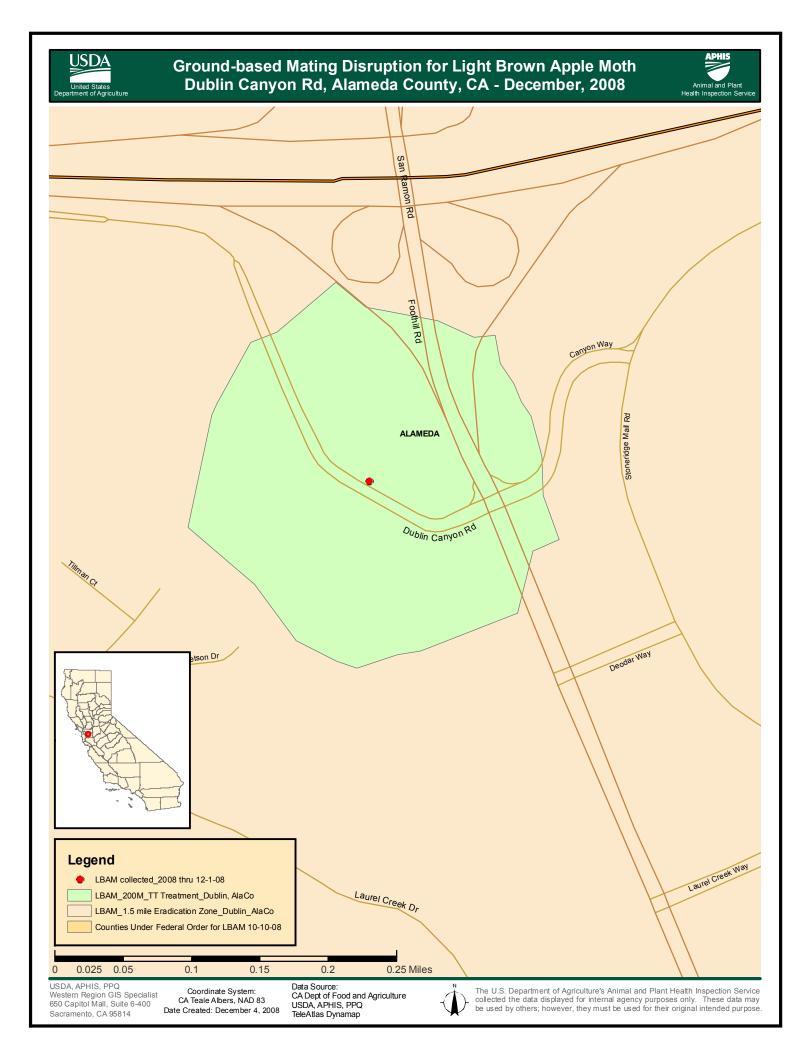

The revised EA evaluated the potential impacts of eradication treatments of small isolated populations like the ones in the eradication zone. Due to the nature of the dispenser and the pheromone itself, there will be no impacts to human health and limited, if any, impacts to nontarget species because the product is contained in dispensers that are tied to fixtures and will be removed after treatment. The pheromone itself has been shown to attract several native tortricids as well as a pyralid based on trap catches that are baited with LBAM pheromone. However, each of these species has a widespread distribution and therefore any impact to these non-targets will be minimal and localized. In addition, there will be no negative cumulative effects from this action in combination with any other actions because the treatments in isolated population areas will not be combined with other LBAM eradication tools.

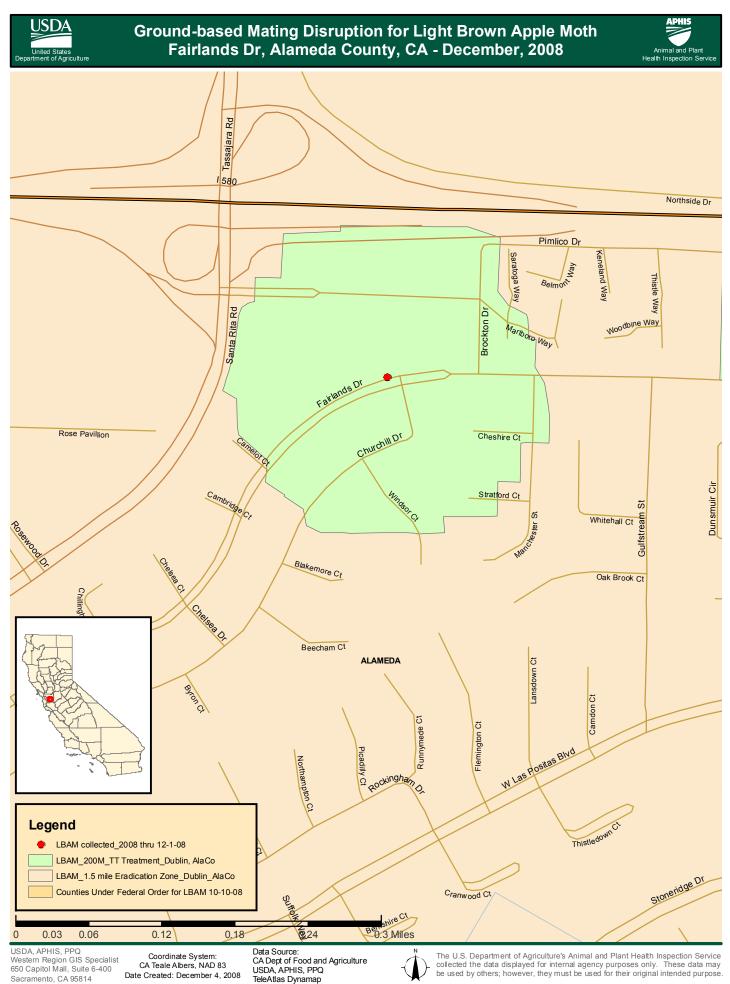

APHIS conducted an online query of the Sacramento Fish and Wildlife Office's (SFWO) species lists available at <a href="http://www.fws.gov/sacramento/es/spp\_lists/auto\_list\_form.cfm">http://www.fws.gov/sacramento/es/spp\_lists/auto\_list\_form.cfm</a>. APHIS has reviewed the eradication boundary and the potential for co-occurrence of listed species and critical habitat. Based on our review of several listed species and critical habitat we are consulting further with the SFWO to determine if any protection measures are necessary. Once APHIS receives final correspondence from the SFWO and consultation is completed, APHIS will incorporate any required protection measures to ensure compliance with section 7 of the Endangered Species Act. APHIS will not deploy twist ties until consultation is completed to ensure that our action will not adversely affect listed species or their designated critical habitat.

APHIS' finding of no significant impact for the treatments within the eradication boundary is based upon the expected limited environmental consequences, as analyzed in the EA. An environmental impact statement (EIS) must be prepared if implementation of the proposed action may significantly affect the quality of the human environment. I have determined that there would be no significant impact to the human environment from the implementation of the treatment alternative and, therefore, no EIS needs to be prepared.
